Tracking seasonally changing resources is regarded as a widespread proximate mechanism underpinning animal migration. Migrating herbivores, for example, are hypothesized to track seasonal foliage dynamics over large spatial scales. Previous investigations of this green wave hypothesis involved few species and limited geographical extent, and used conventional correlation that cannot disentangle alternative correlated effects. Here, we introduce stochastic simulations to test this hypothesis using 222 individual spring migration episodes of 14 populations of ten species of geese, swans and dabbling ducks throughout Europe, East Asia, and North America. We find that the green wave cannot be considered a ubiquitous driver of herbivorous waterfowl spring migration, as it explains observed migration patterns of only a few grazing populations in specific regions. We suggest that ecological barriers and particularly human disturbance likely constrain the capacity of herbivorous waterfowl to track the green wave in some regions, highlighting key challenges in conserving migratory birds.

Method evaluation

A handwritten musical score on a single staff. The notation is dense and includes various symbols and markings. At the top left, there are two double dots ("). Below the staff, there are several markings: a triangle (Δ), an equals sign (=), and a vertical line (|). The notation itself consists of a series of notes and rests, with some notes having stems and flags. There are also several 'v' symbols (accents) placed above or below notes. The overall appearance is that of a complex, possibly experimental or abstract, musical composition.

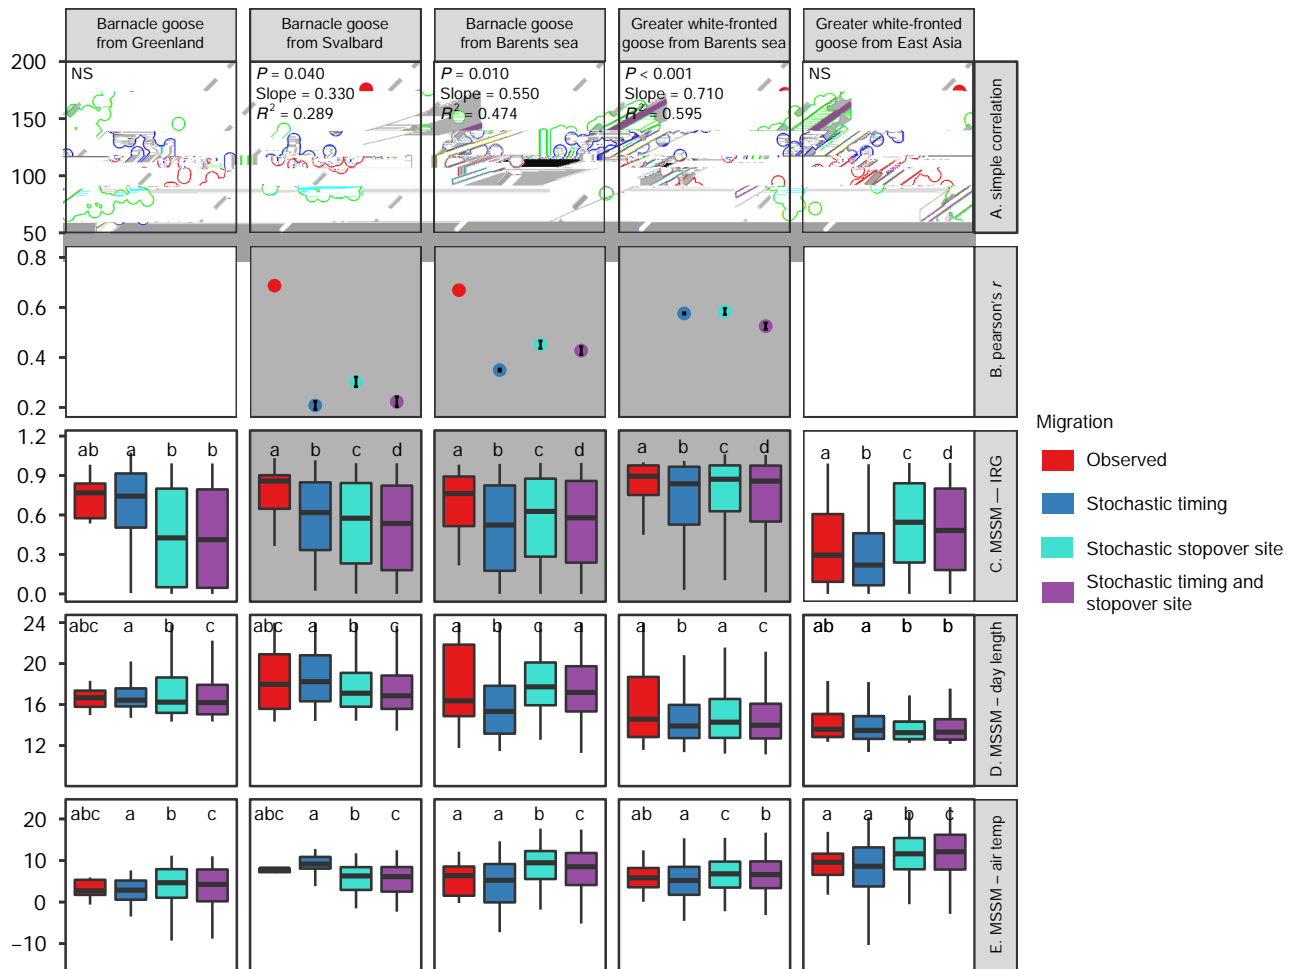

Fig. 2 Testing the green wave hypothesis for grazers by three different methods. We present the results of the Simple Conventional Correlation (a, upper row), Correlation method evaluated by stochastic migrations (b, second row) and the Metric Selection approach based on Stochastic Migrations (MSSMs) (c–e, three lower rows). Red, blue, turquoise and purple dots/boxes denote observed, stochastic timing, stochastic stopover site and stochastic timing and stopover site migrations, respectively. **a** The x and y axes denote the expected arrival day of the year at stopover sites (the day with peak instantaneous rate of green-up [IRG] value) and the observed arrival day of the year by birds, respectively. The grey pecked lines with slope = 1 and intercept = 0 indicate perfect match of migration and green wave. N.S. denotes insignificant slope; otherwise the p-value and coefficient of the slope, and marginal R² are provided. Blue lines show the significant positive slope of the green wave in models of green wave surfers, and grey bands are the prediction intervals of the models. **b** Pearson's correlation coefficient r and 95% CI (y axis) of observed and stochastic migrations (x axis). For populations without available migration tracks, only stochastic timing simulations were performed, compared and plotted. Blank panels denote not applicable because this method only applies to green wave surfers or weak surfers identified by Simple Conventional Correlation. **c–e** Three metrics compared for observed versus stochastic migrations: IRG (instantaneous rate of green-up), day length and air temperature. Lower case letters indicate significantly different groups using Kruskal-Wallis test followed by Dunn's test of multiple comparisons. Boxplots show median, first and third quartiles with whiskers reaching to the last data point within 1.5 × interquartile range. For clear presentation, outliers out of 10 and 90% quantiles were excluded from the plots but kept in all analyses. All grey shaded plots in all panels denote significant migration-green wave associations. Source data are provided as a Source Data file

Handwritten musical notation on a page, featuring various notes, rests, and symbols. The notation is dense and appears to be a complex score, possibly for a string instrument or a specific voice part. It includes various note values, rests, and dynamic markings, all written in black ink on a white background.

A handwritten musical score consisting of approximately 12 staves. The notation includes various rhythmic values such as eighth and sixteenth notes, rests, and dynamic markings like 'p' (piano) and 'f' (forte). The handwriting is dense and appears to be a personal or working draft. The score is oriented vertically on the page.

$$f_i(t) = \alpha + (\beta - \alpha) \cdot \left(\frac{1 - e^{-\gamma(t-\delta)}}{1 + e^{-\gamma(t-\delta)}} + \frac{1 - e^{-\varepsilon(t-\theta)}}{1 + e^{-\varepsilon(t-\theta)}} \right) \quad (1)$$

Stopover/migration information

$$f_i(t) = \alpha + (\beta - \alpha) \cdot \left(\frac{1 - e^{-\gamma(t-\delta)}}{1 + e^{-\gamma(t-\delta)}} + \frac{1 - e^{-\varepsilon(t-\theta)}}{1 + e^{-\varepsilon(t-\theta)}} \right) \quad (1)$$

$$f_i(t) = \alpha + (\beta - \alpha) \cdot \left(\frac{1 - e^{-\gamma(t-\delta)}}{1 + e^{-\gamma(t-\delta)}} + \frac{1 - e^{-\varepsilon(t-\theta)}}{1 + e^{-\varepsilon(t-\theta)}} \right) \quad (1)$$

$$f_i(t) = \alpha + (\beta - \alpha) \cdot \left(\frac{1 - e^{-\gamma(t-\delta)}}{1 + e^{-\gamma(t-\delta)}} + \frac{1 - e^{-\varepsilon(t-\theta)}}{1 + e^{-\varepsilon(t-\theta)}} \right) \quad (1)$$

Remote-sensing data and green wave metrics

$$f_i(t) = \alpha + (\beta - \alpha) \cdot \left(\frac{1 - e^{-\gamma(t-\delta)}}{1 + e^{-\gamma(t-\delta)}} + \frac{1 - e^{-\varepsilon(t-\theta)}}{1 + e^{-\varepsilon(t-\theta)}} \right) \quad (1)$$

Correlation method evaluated by Stochastic Migrations

$$f_i(t) = \alpha + (\beta - \alpha) \cdot \left(\frac{1 - e^{-\gamma(t-\delta)}}{1 + e^{-\gamma(t-\delta)}} + \frac{1 - e^{-\varepsilon(t-\theta)}}{1 + e^{-\varepsilon(t-\theta)}} \right) \quad (1)$$

$$f_i(t) = \alpha + (\beta - \alpha) \cdot \left(\frac{1 - e^{-\gamma(t-\delta)}}{1 + e^{-\gamma(t-\delta)}} + \frac{1 - e^{-\varepsilon(t-\theta)}}{1 + e^{-\varepsilon(t-\theta)}} \right) \quad (1)$$

$$f_i(t) = \alpha + (\beta - \alpha) \cdot \left(\frac{1 - e^{-\gamma(t-\delta)}}{1 + e^{-\gamma(t-\delta)}} + \frac{1 - e^{-\varepsilon(t-\theta)}}{1 + e^{-\varepsilon(t-\theta)}} \right) \quad (1)$$

$$f_i(t) = \alpha + (\beta - \alpha) \cdot \left(\frac{1 - e^{-\gamma(t-\delta)}}{1 + e^{-\gamma(t-\delta)}} + \frac{1 - e^{-\varepsilon(t-\theta)}}{1 + e^{-\varepsilon(t-\theta)}} \right) \quad (1)$$

$$f_i(t) = \alpha + (\beta - \alpha) \cdot \left(\frac{1 - e^{-\gamma(t-\delta)}}{1 + e^{-\gamma(t-\delta)}} + \frac{1 - e^{-\varepsilon(t-\theta)}}{1 + e^{-\varepsilon(t-\theta)}} \right) \quad (1)$$

Simple Conventional Correlation

$$f_i(t) = \alpha + (\beta - \alpha) \cdot \left(\frac{1 - e^{-\gamma(t-\delta)}}{1 + e^{-\gamma(t-\delta)}} + \frac{1 - e^{-\varepsilon(t-\theta)}}{1 + e^{-\varepsilon(t-\theta)}} \right) \quad (1)$$
